

AI-Powered Debate Analyzer and Feedback System

Project Description:

The **AI-Powered Debate Analyzer** is an intelligent Java-based application designed to listen to a user's live speech during a debate or speaking session, analyze it in real-time, and provide interactive feedback. It uses **speech recognition, natural language processing (NLP), and AI models** to assess key aspects like **grammar, vocabulary, voice clarity, and confidence level**. After the session, the system gives a **rating out of 10** and personalized suggestions for improvement.

This tool acts like a **virtual coach** for students, professionals, and public speakers, helping them practice and refine their debating or speaking skills.

Main Features:

Real-Time Speech Recognition

Converts spoken words to text instantly using speech-to-text technology.

AI-Based Reply System

Responds in real-time to the user's speech using an AI model like GPT.

Grammar & Vocabulary Check

Detects grammatical errors, vocabulary strength, and sentence structure.

Confidence & Voice Analysis

Evaluates voice clarity, volume, tone, and confidence based on speaking pattern.

Rating System (Out of 10)

Provides scores on grammar, vocabulary, confidence, and fluency.

Personalized Suggestions

Recommends improvements and tips based on detected mistakes.

Session Summary Report

Generates a summary of feedback and suggestions after each debate session.

Performance History Tracking

Stores past debate session records and ratings to monitor improvement over time.
